ES6 Modules and Classes

Module Basics

Named Exports

Classes

extends and super

Constructor Function Properties

Static Members

new.target

Module Basics

File base.js:

```javascript
console.log('in base.js');
```

What shows in the console?

in base.js

File base.js:

```
projectId = 99;

console.log('in base.js');
```

What shows in the console?

Runtime Error:

Variable undefined in strict mode

File base.js:

```javascript
import { projectId } from 'module1.js';

console.log(projectId);
```

File module1.js:

```javascript
export let projectId = 99;
```

What shows in the console?

99

File base.js:

```javascript
import { projectId, projectName } from 'module1.js';
console.log(`${projectName} has id: ${projectId}`);
```

File module1.js:

```javascript
export let projectId = 99;
export let projectName = 'BuildIt';
```

Q What shows in the console? | **A** BuildIt has id: 99

File base.js:

```
import { projectId as id, projectName } from 'module1.js';
console.log(`${projectName} has id: ${id}`);
```

File module1.js:

```
export let projectId = 99;
export let projectName = 'BuildIt';
```

Q What shows in the console? | A BuildIt has id: 99

File base.js:

```
import { projectId as id, projectName } from 'module1.js';
console.log(`${projectName} has id: ${projectId}`);
```

File module1.js:

```
export let projectId = 99;
export let projectName = 'BuildIt';
```

Q What shows in the console?

A Runtime error:
projectId is undefined

File base.js:

```javascript
console.log('starting in base');
import { projectId } from 'module1.js';
console.log('ending in base');
```

File module1.js:

```javascript
export let projectId = 99;
console.log('in module1');
```

Q What shows in the console?

A in module1
starting in base
ending in base

File base.js:

```javascript
import someValue from 'module1.js';
console.log(someValue);
```

File module1.js:

```javascript
export let projectId = 99;
let projectName = 'BuildIt';
export default projectName;
```

Q What shows in the console? | **A** BuildIt

File base.js:

```
import { default as myProjectName } from 'module1.js';
console.log(myProjectName);
```

File module1.js:

```
export let projectId = 99;
let projectName = 'BuildIt';
export default projectName;
```

Q   What shows in the console? | A   BuildIt

File base.js:

```javascript
import someValue from 'module1.js';
console.log(someValue);
```

File module1.js:

```javascript
let projectId = 99;
let projectName = 'BuildIt';
export { projectId, projectName };
```

Q What shows in the console? | **A** undefined

File base.js:

```
import someValue from 'module1.js';
console.log(someValue);
```

File module1.js:

```
let projectId = 99;
let projectName = 'BuildIt';
export { projectId as default, projectName };
```

Q What shows in the console? | **A** 99

File base.js:

```
import * as values from 'module1.js';
console.log(values);
```

File module1.js:

```
let projectId = 99;
let projectName = 'BuildIt';
export { projectId, projectName };
```

Q What shows in the console?

A { projectId: 99,
projectName: 'BuildIt'}

Named Exports in Modules

File base.js:

```javascript
import { projectId } from 'module1.js';
projectId = 8000;
console.log(projectId);
```

File module1.js:

```javascript
export let projectId = 99;
```

Q   What shows in the console? | A   Runtime error: projectId is read-only

File base.js:

```
import { project } from 'module1.js';
project.projectId = 8000;
console.log(project.projectId);
```

File module1.js:

```
export let project = {
    projectId: 99
};
```

What shows in the console?   8000

File base.js:

```js
import { project, showProject } from 'module1.js';
project.projectId = 8000;
showProject();
console.log(project.projectId);
```

File module1.js:

```js
export let project = { projectId: 99 };

export function showProject() {
    console.log(project.projectId);
};
```

Q What shows in the console? | A 8000
8000

File base.js:

```javascript
import { showProject, updateFunction } from 'module1.js';
showProject();
updateFunction();
showProject();
```

File module1.js:

```javascript
export function showProject() { console.log('in original'); }
export function updateFunction() {
    showProject = function () { console.log('in updated'); };
};
```

Q What shows in the console?

A in original
in updated

Class Fundamentals

```
class Task {

}

console.log(typeof Task);
```

What shows in the console?

function

```
class Task {

}
let task = new Task();
console.log(typeof task);
```

What shows in the console?

object

```
class Task {

}
let task = new Task();
console.log(task instanceof Task);
```

What shows in the console?

true

```
class Task {
    showId() {
        console.log('99');
    }
}
let task = new Task();
task.showId();
```

What shows in the console?

Answer

99

```
class Task {
    showId() {
        console.log('99');
    }
}
let task = new Task();
console.log(task.showId === Task.prototype.showId);
```

Q What shows in the console? | **A** true

```
class Task {
    constructor() {
        console.log('constructing Task');
    }
    showId() {
        console.log('99');
    }
}
let task = new Task();
```

Q What shows in the console? | **A** constructing Task

```
class Task {
    constructor() {
        console.log('constructing Task');
    },
    showId() {
        console.log('99');
    }
}
let task = new Task();
```

Q   What shows in the console? | A   Syntax error

```
class Task {
    let taskId = 9000;
    constructor() {
        console.log('constructing Task');
    }
    showId() {
        console.log('99');
    }
}
let task = new Task();
```

Q What shows in the console? | A Syntax error

```
let task = new Task();

class Task {
    constructor() {
        console.log('constructing Task');
    }
}
```

Q What shows in the console? | A Error: Use before declaration

```
let newClass = class Task {
    constructor() {
        console.log('constructing Task');
    }
};

new newClass();
```

```
let Task = function () {
    console.log('constructing Task');
};
let task = {};
Task.call(task);
```

Q What shows in the console? | A constructing Task

```
class Task {
    constructor() {
        console.log('constructing Task');
    }
};
let task = {};
Task.call(task);
```

What shows in the console?

Error: class constructor cannot be called with the new keyword

```
function Project() { };

console.log(window.Project === Project);
```

```
class Task { }

console.log(window.Task === Task);
```

Q What shows in the console? | **A** false

extends and super

```
class Project {
    constructor() {
        console.log('constructing Project');
    }
}

class SoftwareProject extends Project {

}

let p = new SoftwareProject();
```

```
class Project {
    constructor(name) {
        console.log('constructing Project: ' + name);
    }
}

class SoftwareProject extends Project {
}

let p = new SoftwareProject('Mazatlan');
```

Q What shows in the console? | **A** constructing Project: Mazatlan

```javascript
class Project {
    constructor() {
        console.log('constructing Project');
    }
}
class SoftwareProject extends Project {
    constructor() {
        super();
        console.log('constructing SoftwareProject');
    }
}
let p = new SoftwareProject();
```

Q What shows in the console? | **A** constructing Project

constructing SoftwareProject

```
class Project {
    constructor() {
        console.log('constructing Project');
    }
}
class SoftwareProject extends Project {
    constructor() {
        //super();
        console.log('constructing SoftwareProject');
    }
}
let p = new SoftwareProject();
```

Q What shows in the console?

A ReferenceError: this is not defined

```
class Project {
    //constructor() {
    //    console.log('constructing Project');
    //}
}
class SoftwareProject extends Project {
    constructor() {
        //super();
        console.log('constructing SoftwareProject');
    }
}
let p = new SoftwareProject();
```

Q What shows in the console?

A ReferenceError: this is not defined

```
class Project {
    constructor() {
        console.log('constructing Project');
    }
}
class SoftwareProject extends Project {
    constructor() {
        super();
        console.log('constructing SoftwareProject');
    }
}
let p = new SoftwareProject();
```

Q What shows in the console?

A constructing Project
constructing SoftwareProject

```
class Project {
    getTaskCount() {
        return 50;
    }
}
class SoftwareProject extends Project {
}
let p = new SoftwareProject();
console.log(p.getTaskCount());
```

Q What shows in the console?   **A** 50

```
class Project {
    getTaskCount() {
        return 50;
    }
}
class SoftwareProject extends Project {
    getTaskCount() {
        return 66;
    }
}
let p = new SoftwareProject();
console.log(p.getTaskCount());
```

Q What shows in the console? | **A** 66

```
class Project {
    getTaskCount() {
        return 50;
    }
}
class SoftwareProject extends Project {
    getTaskCount() {
        return super.getTaskCount() + 6;
    }
}
let p = new SoftwareProject();
console.log(p.getTaskCount());
```

Q   What shows in the console? | A   56

```
let project = {
    getTaskCount() { return 50; }
};
let softwareProject = {
    getTaskCount() {
        return super.getTaskCount() + 7;
    }
}
Object.setPrototypeOf(softwareProject, project);

console.log(softwareProject.getTaskCount());
```

What shows in the console? | 57

Properties for Class Instances

```
class Project {
    constructor() { this.location = 'Mazatlan'; }
}
class SoftwareProject extends Project {
    constructor() {
        super();
    }
}
let p = new SoftwareProject();
console.log(p.location);
```

Q What shows in the console? | **A**   Mazatlan

```javascript
class Project {
    constructor() { let location = 'Mazatlan'; }
}
class SoftwareProject extends Project {
    constructor() {
        super();
    }
}
let p = new SoftwareProject();
console.log(p.location);
```

Q What shows in the console? | A undefined

```
class Project {
    constructor() { this.location = 'Mazatlan'; }
}
class SoftwareProject extends Project {
    constructor() {
        super();
        this.location = this.location + ' Beach';
    }
}
let p = new SoftwareProject();
console.log(p.location);
```

Q What shows in the console? | **A** Mazatlan Beach

Static Members

```
class Project {
    static getDefaultId() {
        return 0;
    }
}
console.log(Project.getDefaultId());
```

```
class Project {
    static getDefaultId() {
        return 0;
    }
}
var p = new Project();
console.log(p.getDefaultId());
```

A   Error: Object doesn't support property or method getDefaultId

```
class Project {
    static let id = 0;
}
console.log(Project.id);
```

```
class Project {

}
Project.id = 99;
console.log(Project.id);
```

Q What shows in the console? | **A** 99

new.target

```
class Project {
    constructor() {
        console.log(typeof new.target);
    }
}
var p = new Project();
```

Q   What shows in the console?   A   function

```
class Project {
    constructor() {
        console.log(new.target);
    }
}
var p = new Project();
```

Q What shows in the console?

A constructor() {
console.log(new.target); }

```
class Project {
    constructor() {
        console.log(new.target);
    }
}
class SoftwareProject extends Project {
    constructor() {
        super();
    }
}
var p = new SoftwareProject();
```

Q What shows in the console?

A
```
constructor() {
    super();
}
```

```
class Project {
    constructor() {
        console.log(new.target);
    }
}
class SoftwareProject extends Project {
}
var p = new SoftwareProject();
```

Q What shows in the console?

A constructor(...args) {
    super(...args);
}

```
class Project {
    constructor() {
        console.log(new.target.getDefaultId());
    }
}
class SoftwareProject extends Project {
    static getDefaultId() { return 99; }
}
var p = new SoftwareProject();
```

Q   What shows in the console? | A   99

Summary

Module Basics

```
File base.js:

import { projectId } from 'module1.js';

console.log(projectId);

File module1.js:

export let projectId = 99;
```

Summary

Named Exports

```
File base.js:

import { project } from 'module1.js';
project.projectId = 8000;
console.log(project.projectId);

File module1.js:

export let project = {
    projectId: 99
};
```

Summary

Classes

```javascript
class Task {
    constructor() {
        console.log('constructing Task');
    }
    showId() {
        console.log('99');
    }
}
let task = new Task();
```

Summary

extends and super

```javascript
class Project {
    constructor() {
        console.log('constructing Project');
    }
}
class SoftwareProject extends Project {
    constructor() {
        super();
        console.log('constructing SoftwareProject');
    }
}
let p = new SoftwareProject();
```

Summary

Constructor Function Properties

```javascript
class Project {
    constructor() { this.name = 'Mazatlan'; }
}
class SoftwareProject extends Project {
    constructor() {
        super();
    }
}
let p = new SoftwareProject();
console.log(p.name);
```

Summary

Static Members

```
class Project {
    static getDefaultId() {
        return 0;
    }
}
console.log(Project.getDefaultId());
```

Summary

new.target

```js
class Project {
    constructor() {
        console.log(new.target);
    }
}
class SoftwareProject extends Project {
}
var p = new SoftwareProject();
```
